What voltage is a lithium ion battery?

A lithium-ion battery's nominal or standard voltage is nearly 3.60V per cell. Some battery manufacturers mark lithium-ion batteries as 3.70V per cell or higher. What voltage is overcharged on a lithium battery? Overcharging means charging the lithium-ion battery beyond its fully charged voltage.

How do you calculate the voltage of a battery pack?

The voltage of a battery pack is determined by the series configuration. Each 18650 cell typically has a nominal voltage of 3.7V. To calculate the total voltage of the battery pack, multiply the number of cells in series by the nominal voltage of one cell.

What is the difference between a lithium ion battery and a battery pack?

While a lithium-ion cell is a single battery unit, a battery pack combines multiple cells in series or parallel. The typical lifespan of lithium-ion batteries is around 300-1000 charge cycles. Voltage vs. Charging Relations  
The relation between voltage and the battery's charge is often overlooked, but it's important.

What is a cut-off voltage for a lithium ion battery?

Cut-off Voltage: This is the minimum voltage allowed during discharge, usually around 2.5V to 3.0V per cell. Going below this can damage the battery. Charging Voltage: This is the voltage applied to charge the battery, typically 4.2V per cell for most lithium-ion batteries.

What is the relationship between voltage and charge in a lithium-ion battery?

The relationship between voltage and charge is at the heart of lithium-ion battery operation. As the battery discharges, its voltage gradually decreases. This voltage can tell us a lot about the battery's state of charge (SoC) - how much energy is left in the battery. Here's a simplified SoC chart for a typical lithium-ion battery:

What is a normal battery voltage?

Nominal Voltage: This is the battery's "advertised" voltage. For a single lithium-ion cell, it's typically 3.6V or 3.7V. Open Circuit Voltage: This is the voltage when the battery isn't connected to anything. It's usually around 3.6V to 3.7V for a fully charged cell. Working Voltage: This is the actual voltage when the battery is in use.
