How to calculate capacitance of a capacitor?

The following formulas and equations can be used to calculate the capacitance and related quantities of different shapes of capacitors as follow. The capacitance is the amount of charge stored in a capacitor per volt of potential between its plates. Capacitance can be calculated when charge  $Q$  & voltage  $V$  of the capacitor are known:  $C = Q/V$

How do you calculate a charge on a capacitor?

The greater the applied voltage the greater will be the charge stored on the plates of the capacitor. Likewise, the smaller the applied voltage the smaller the charge. Therefore, the actual charge  $Q$  on the plates of the capacitor and can be calculated as: Where:  $Q$  (Charge, in Coulombs) =  $C$  (Capacitance, in Farads) x  $V$  (Voltage, in Volts)

What happens when a capacitor is charged?

From the above discussion, we can conclude that during charging of a capacitor, the charge and voltage across the capacitor increases exponentially, while the charging current decreases. A charged capacitor stores electrical energy in the form of electrostatic charge in the dielectric medium between the plates of the capacitor.

What is capacitance  $C$  of a capacitor?

The capacitance  $C$  of a capacitor is defined as the ratio of the maximum charge  $Q$  that can be stored in a capacitor to the applied voltage  $V$  across its plates. In other words, capacitance is the largest amount of charge per volt that can be stored on the device:  $C = Q/V$

What is a charge of a capacitor?

The process of storing electrical energy in the form of electrostatic field when the capacitor is connected to a source of electrical energy is known as charging of capacitor. This stored energy in the electrostatic field can be delivered to the circuit at a later point of time.

How do capacitors store electrical charge between plates?

The capacitors ability to store this electrical charge ( $Q$ ) between its plates is proportional to the applied voltage,  $V$  for a capacitor of known capacitance in Farads. Note that capacitance  $C$  is ALWAYS positive and never negative. The greater the applied voltage the greater will be the charge stored on the plates of the capacitor.
