

Analysis of industrial application of phase change energy storage materials

Are phase change materials suitable for thermal energy storage?

Phase change materials (PCMs) having a large latent heat during solid-liquid phase transition are promising for thermal energy storage applications. However, the relatively low thermal conductivity of the majority of promising PCMs ($<10 \text{ W/(m} \cdot \text{K)}$) limits the power density and overall storage efficiency.

Which phase change is used for heat storage?

Large volumes or high pressures are required for thermal storage of materials in the gas phase, making the system complex and impracticable. As a result, the sole phase change used for heat storage is the solid-liquid phase change. The characteristics of solid-solid and solid-liquid PCMs is shown in Table 1. Table 1.

Why are phase change materials difficult to design?

Phase change materials (PCMs), which are commonly used in thermal energy storage applications, are difficult to design because they require excellent energy density and thermal transport, both of which are difficult to predict from simple physics-based models.

What are solid-liquid phase change materials (PCMs)?

Solid-liquid phase change materials (PCMs) have become critical in developing thermal energy storage (TES) technology because of their high energy storage density, high latent heat, and excellent constant temperature performance during phase change.

What is latent heat storage utilizing phase change materials (PCMs)?

Among them, latent heat storage utilizing phase change materials (PCMs) offers advantages such as high energy storage density, a wide range of phase change temperatures, and the ability to maintain a nearly constant operating temperature during the heat storage process. These properties make it an excellent approach for store heat [1, 2].

Can phase change materials be used in heating and cooling systems?

Phase change materials can be used in cooling and heating systems that are both active and passive. Passive heating and cooling operate by utilizing thermal energy directly from solar or natural convection.
