

Four-terminal method for measuring solar cells

Do physical parameters affect tandem solar cell efficiency?

Through innovative material exploration, optimization techniques are explored to advance the performance boundaries of organic/silicon tandem solar cells. The study employs the Beer-Lambert law to assess the impact of varied physical parameters on tandem solar cell efficiency, aiming to propose optimal configurations.

Why are tandem solar cells becoming a focal point?

Tandem solar cells have become a focal point due to their promise of achieving remarkable efficiency using cost-effective materials and processes. In the 4-terminal (4-T) tandem configuration, wide-bandgap and narrow-bandgap sub-cells are stacked mechanically.

Can 4-terminal organic/silicon tandem solar cells improve light absorption?

This study delves into the performance and optimization of 4-terminal organic/silicon tandem solar cells through numerical simulations using SCAPS-1D software. The tandem architecture combining organic, perovskite, and silicon materials, shows potential in enhancing light absorption across the solar spectrum with complementary absorption spectra.

How do tandem solar cells work?

In a tandem configuration, subcells are stacked on top of each other in a way that different parts of the solar spectrum are absorbed by each subcell, corresponding to their bandgap energy. Tandem solar cells (TSCs) enhance efficiency, reduce thermal loss, provide integration, easy protection, and cleaning.

Does cell area affect conversion efficiency of a 4T tandem solar cell?

The efficiency of a solar cell is strongly influenced by cell area. Therefore, when reporting the conversion efficiency of a single 4T TSC, the efficiencies of the subcells should be measured with the same cell area. What is the PCE of 4T perovskite/Si tandem solar cell?

Finally, the PCE of 20.3% and 9.35% were obtained in the top and bottom cells for the optimized 4T perovskite/Si tandem solar cell. This project was supported by Sahand University of Technology (SUT), Tabriz city, Sahand town, Iran on contract No. 14802.
