What are OEM batteries?

Original Equipment Manufacturer (OEM) batteries are either made by the company that makes the device itself or on their behalf by a different company. They are the batteries that come with the device when it's purchased by a consumer and are also sold by the device's manufacturer as 'official' replacement batteries.

What is the difference between OEM and non-OEM battery?

An OEM (Original Equipment Manufacturer) battery is the battery produced by the same company that made the original equipment. Non-OEM batteries, on the other hand, are manufactured by a different company or third party and are essentially reverse engineered versions of the original battery. The main differences between OEM and non-OEM batteries include quality, which may not be exactly the same in non-OEM batteries. For purchasing an OEM battery, check with the original equipment manufacturer.

How do OEM batteries work?

Private Labeling Approach: In the OEM model, the batteries are already designed and manufactured by one company. Another company then purchases these batteries to sell under its own brand name, a process commonly known as private labeling.

How to purchase an OEM battery?

To buy an OEM battery, you need to get it directly from the original equipment manufacturer or the official dealer of that company. The OEM battery is manufactured and installed by the original manufacturer. Keep in mind that purchasing an OEM battery will typically cost more.

What are OEM batteries & non-OEM batteries?

OEM batteries refer to those manufactured by the original equipment manufacturer for specific devices, such as laptops or smartphones. These batteries are designed to meet exact specifications and quality standards set by the device manufacturer, ensuring optimal performance and safety. What are non-OEM batteries?
