

# How many groups of batteries does new energy consist of

How many types of batteries are there?

Though we may group them all under the single term "batteries," there are actually some 35 different types based on combinations of materials alone. If we factor in different shapes and sizes, then there are around 4,000 different kinds of battery.

What are the components of a next-generation battery?

These next-generation batteries may also use different materials that purposely reduce or eliminate the use of critical materials, such as lithium, to achieve those gains. The components of most (Li-ion or sodium-ion [Na-ion]) batteries you use regularly include: A current collector, which stores the energy.

What is the difference between a chemical battery and a physical battery?

One is "chemical batteries" which generate electricity through chemical reactions between metallic compounds and such like. Another is "physical batteries" which generate electricity through solar or thermal energy. Let's look at "chemical batteries" here.

What is a secondary battery?

The batteries we usually call "dry batteries" - the ones whose energy will eventually run out after prolonged use - are properly known as "primary batteries." Then, we have those which unlike "primary batteries" can be recharged and used again after they run out. These rechargeable batteries are properly known as "secondary batteries".

What are the components of a lithium ion battery?

The components of most (Li-ion or sodium-ion [Na-ion]) batteries you use regularly include: A current collector, which stores the energy. Solid-state batteries use solid electrolyte solutions, which don't need a different separator. That makes them safer because they are less prone to leakage from damage or swelling in hot temperatures.

What are the different types of chemical batteries?

"Chemical batteries" can be further divided into two main types. The batteries we usually call "dry batteries" - the ones whose energy will eventually run out after prolonged use - are properly known as "primary batteries." Then, we have those which unlike "primary batteries" can be recharged and used again after they run out.
