How often should a lead acid battery be recharged?

Sealed lead acid batteries need to be kept above 70% State of Charge (SoC). If you are storing your batteries at the ideal temperature and humidity levels then a general rule of thumb would be to recharge the batteries every six months. However if you are not sure then you can check the voltage as follows:

How to choose a lead-acid battery?

Hence when choosing a battery, it is important to keep in mind a general rule: whatever the calculated power capacity of a lead-acid battery is, halve it to get the actual usable capacity. This is because, in general, you can only use a maximum of half the total capacity of a lead-acid battery before needing to charge it back up again.

What temperature should lead acid batteries be stored?

All lead acid batteries discharge when in storage - a process known as 'calendar fade' - so the right environment and active maintenance are essential to ensure the batteries maintain their ability to achieve full capacity. This is true of both flooded lead acid and sealed lead acid batteries. The ideal storage temperature is 50°F(10°C).

Can a lead-acid battery be used again?

This is because, in general, you can only use a maximum of half the total capacity of a lead-acid battery before needing to charge it back up again. Doing otherwise would dramatically shorten your battery life and is not advised.

How long does a sealed lead battery last?

Assuming a sealed lead battery is stored at the ideal temperature and regularly recharged when required, its life can be 3- 4 years in storage. Was this article helpful?

What is battery power capacity?

Since this is a particularly confusing part of measuring batteries, I'm going to discuss it more in detail. Power capacity is how much energy is stored in the battery. This power is often expressed in Watt-hours (the symbol Wh).
