

How to calculate battery power wattage

How do I calculate battery capacity?

Enter the battery voltage in volts (V). Enter the power consumption of the device in watts (W). Enter the overall efficiency of your setup in percentage (%). Default is 100%. Click the "Calculate" button to see the estimated runtime in hours. The calculator converts battery capacity from mAh to watt-hours (Wh). The formula used is:

How do I calculate the runtime of a battery?

Default is 100%. Click the "Calculate" button to see the estimated runtime in hours. The calculator converts battery capacity from mAh to watt-hours (Wh). The formula used is: $\text{batteryWh} = (\text{batteryCapacity} * \text{voltage}) / 1000$ Then it divides this energy by the power consumption of the device to estimate the running time:

How do you calculate a 12 volt battery capacity?

For example, if you have a 12-volt battery that can provide 1 amp of current for 3 hours, the capacity of the battery is: $\text{amp hours} = 1 \text{ amps} \times 3 \text{ hours} = 3 \text{ amp hours}$. We have already shown various methods explaining how to calculate amp hours (Ah). Let's now see the particular battery capacity formulae:

Why should you use a battery capacity calculator?

The battery capacity calculator is an excellent choice if you want to know what battery capacity is or if you need to compute the properties of various batteries and compare them before purchasing a new battery. We need batteries to power our phones, laptops, and cars, and knowing how to calculate their amp hours is a crucial thing.

How do you calculate a battery Ah?

To calculate amp hours, you need to know the voltage of the battery and the amount of energy stored in the battery. Multiply the energy in watt-hours by voltage in volts, and you will obtain amp hours. Alternatively, if you have the capacity in mAh and you want to make a battery Ah calculation, simply use the equation: $\text{Ah} = (\text{capacity in mAh}) / 1000$.

How do you calculate battery efficiency?

The formula used is: $\text{batteryWh} = (\text{batteryCapacity} * \text{voltage}) / 1000$ Then it divides this energy by the power consumption of the device to estimate the running time: $\text{runningTime} = (\text{batteryWh} * \text{efficiency}) / \text{devicePower}$ The calculator assumes a constant power consumption which may not be true for all devices. The efficiency value is an approximation.
