

Is the battery a power source or an electrical appliance

What is the power of an appliance?

The power of an appliance is the amount of energy (J) that it transfers per second. In other words, power is the rate of energy transfer. Energy is transferred in everyday appliances, including electronic appliances. For example kettles, microwaves and hairdryers can all convert electrical energy into other forms of energy, which we can then use.

Does a cell or battery supply direct current?

This means that it does not change over time. Cells and batteries supply direct current (dc). This means that in a circuit with an energy supply from a cell or battery, the current is always in the same direction in the circuit. The oscilloscope gives the following display for the electricity from the mains.

What is the difference between power and energy store?

Power = work done \div time taken. energy store The different ways in which energy can be stored, including chemical, kinetic, gravitational potential, elastic potential and thermal stores. power = current \times potential difference This is when: current Moving electric charges, eg electrons moving through a metal wire.

How does electricity work?

Electricity can flow either as direct or alternating current, and is used in homes to power electrical appliances. The National Grid distributes electricity throughout the country. energy transfers Changes from one form of energy to another form of energy.

Do appliances transfer energy?

Appliances can transfer energy. Everyday electrical appliances in our homes are designed to bring about energy transfers. For example, kettles, microwaves and hairdryers can all convert electrical energy into other forms of energy, which we can then use. The amount of energy transfer can vary.

How do batteries convert chemical energy to electrical energy?

Batteries convert chemical energy directly to electrical energy. In many cases, the electrical energy released is the difference in the cohesive [17] or bond energies of the metals, oxides, or molecules undergoing the electrochemical reaction.
