Can long duration electricity storage help decarbonise our energy system?

We're consulting on the policy framework to enable investment in long duration electricity storage. Long duration electricity storage can provide an important contribution to decarbonising our energy system. For example, it can store renewable power and discharge it during periods of low wind.

What is long duration electricity storage (LDEs)?

Long duration electricity storage (LDES) will be pivotal in delivering a smart and flexible energy system that can integrate high volumes of low carbon power, heat, and transport.

Why are we legislating electricity storage?

Why are we legislating? Electricity storage covers a range of technologies that store low carbon energy for when it is needed, for example in batteries on the wall of your home or business, or in facilities that pump water to higher reservoirs when electricity is abundant, and let it flow back down through a turbine when it is scarce.

Can long duration electricity storage save energy?

Long Duration Electricity Storage would reduce costs to consumers through lowering their energy bills, by avoided electricity grid reinforcement and avoided peak generational plant build. LCP's modelling estimates savings for the energy system (and ultimately the energy consumer) of up to £24 billion by 2050.

Do long duration electricity storage technologies deliver flexibility?

This study provides an independent assessment of the role of a range of long duration electricity storage (LDES) technologies at different scales in delivering the flexibility needed for the electricity system.

Where can I find a long-duration energy storage proposal?
