

# Notes on parallel connection of lead-acid batteries

Can a lead acid battery be connected together?

If you connect two lead acid batteries together for loads only (somewhat difficult to achieve), the battery with the greater charge will try to charge the lower one. However, they will eventually stay equal but this will not last.

How to connect batteries in parallel?

Connecting batteries in Parallel is normally performed to increase capacity. This can be done by connecting the positive terminal of the first battery to the positive terminal of the second battery. Likewise, the negative terminal of the first battery is connected to the negative terminal of the second battery.

What happens if two batteries are connected in parallel?

Likewise, the negative terminal of the first battery is connected to the negative terminal of the second battery. When charging multiple batteries connected in parallel, batteries in the string will receive the same charge voltage but the charge current each battery receives will vary until equalization is reached.

Why do I need a parallel battery configuration?

Connecting batteries that are different can lead to trouble. The goal of parallel battery configurations is to increase your system's overall capacity. This is used when you want your application to run longer between charging. The voltage will not increase using this connection method.

How do I connect a lead acid battery?

There are three ways to connect your lead acid batteries--parallel, series, and a combination known as series/parallel. We cover each of these battery configurations in greater detail in our Battery Basics tutorial section of the site should you want to delve in a little deeper or reinforce what you already know.

Should a lead acid battery be positive or negative?

**Safety Rule #2 -- When Installing a Battery Start with the Positive** There is a serious amount of stored potential energy available in a sealed lead acid battery. A shorted car battery, for example, can deliver several hundred amps in the blink of an eye. To put that in perspective that is more than an arc-welding machine.

However, if you can spend the time watching the system and replacing one battery at a time--go ahead. Note, when you parallel batteries, you should have a fuse/breaker per string to prevent ...
