

How does a compensating capacitor affect power transfer?

When multiplied by the voltage across the load this leads to the same increased level of power, given by Eq. (22.6), as with parallel compensation. As shown by Eq. (22.6), compensating capacitors on the secondary side of an IPT circuit allow for an increase in power transfer by the  $Q$  of the secondary circuit.

Can parallel capacitors cause super synchronous resonances?

This solution is not feasible, since the amount of the grid impedance, thus its resonance frequency, varies depending on the operating conditions of the power system. The application of parallel compensation instead of series compensation is possible as well. But the parallel capacitors may cause super-synchronous resonances.

What are series-parallel ( $S_p$ ) compensation topologies in capacitive power transfer (CPT)?

This paper analyzed the four series-parallel (SP) compensation topologies to achieve constant current (CC) and voltage (CV) output characteristics and zero phase angle (ZPA) input conditions with fewer compensation components in the capacitive power transfer (CPT) system. There are three main contributions.

What are the disadvantages of a parallel active compensator?

Voltage mode parallel active compensators have one significant disadvantage: the power factor depends on the load's active power and line voltage. This causes PF deterioration, especially in the case of line voltage dips and swells (although the load voltage in PCC still is stable).

What is total capacitance (CT) of a parallel connected capacitor?

One important point to remember about parallel connected capacitor circuits, the total capacitance ( $CT$ ) of any two or more capacitors connected together in parallel will always be GREATER than the value of the largest capacitor in the group as we are adding together values.

How to calculate the total capacitance of a parallel circuit?

We can also define the total capacitance of the parallel circuit from the total stored coulomb charge using the  $Q = CV$  equation for charge on a capacitor's plates. The total charge  $QT$  stored on all the plates equals the sum of the individual stored charges on each capacitor therefore,
