How effective are perovskite solar cells?

Perovskite solar cells (PSCs) have emerged as a subject of strong scientific interest despite their remarkable photoelectric characteristics and economically viable manufacturing processes. After more than ten years of delicate research, PSCs' power conversion efficiency (PCE) has accomplished an astonishing peak value of 25.7%.

What factors affect the stability of perovskite solar cells?

Furthermore, the instability of perovskite materials can cause problems like hysteresis, or variations in the solar cell's output voltage, and lower PCE. In this section, we will review the several factors that affect the stability of PSCs. Moisture intrusion is a significant challenge that can lead to the degradation of PSCs.

What are the challenges faced by perovskite solar cells?

These challenges range from ensuring material stability to scaling up manufacturing processes. Overcoming these obstacles is imperative to fully harness the capabilities of perovskite solar cell technology and facilitate its widespread integration into the renewable energy sector.

Can perovskite photovoltaics compete with thin-film microcrystalline silicon PVS?

Perovskite photovoltaics have rapidly risen to become one of the research frontiers with the most potential to compete with thin-film microcrystalline silicon PVs. It is paramount to understand the working principles, materials, architecture, and fabrication processes of perovskite thin films to make highly efficient solar cells.

Why is perovskite a solar material?

The perovskite family of solar materials is named for its structural similarity to a mineral called perovskite, which was discovered in 1839 and named after Russian mineralogist L.A. Perovski. The original mineral perovskite, which is calcium titanium oxide (CaTiO_3), has a distinctive crystal configuration.

What is the difference between a photovoltaic and a perovskite solar cell?

Conventional photovoltaics are typically made from Si and 25.1% power conversion efficiency was reported for thin-film Si-crystals. Perovskite solar cells (PSCs) derived their name from the light-harvesting layer within the device which is made of perovskite-structured compounds.
