

Polymer photovoltaic cell efficiency

Are polymer solar cells efficient?

Polymer solar cells have shown potential to harness solar energy in a cost-effective way. Significant efforts are underway to improve their efficiency to the level of practical applications. Here, we report highly efficient polymer solar cells based on a bulk heterojunction of polymer poly (3-hexylthiophene) and methanofullerene.

What is the power conversion efficiency of polymer solar cells?

The FF also increased to a value of more than 67%, which is among the highest values reported for polymer solar cells. As a result, we achieved device power conversion efficiency (PCE) of 4.4% under the standard AM1.5G 1 Sun test condition.

Are all-polymer solar cells good for organic photovoltaics?

Through this research, the impressive performance and stability prove that the all-PSCs have great superiority in organic photovoltaics. The field of all-polymer solar cells (all-PSCs) has experienced rapid development during the past few years, mainly driven by the design of efficient polymer acceptors (PAs).

Are polymer solar cells a cost-effective alternative to silicon-based solar cells?

Polymer solar cells have evolved as a promising cost-effective alternative to silicon-based solar cells 1,2,3. Some of the important advantages of these so-called 'plastic' solar cells include low cost of fabrication, ease of processing, mechanical flexibility and versatility of chemical structure from advances in organic chemistry.

What are the applications of polymer solar cells?

The potential applications of polymer solar cells are broad, ranging from flexible solar modules and semitransparent solar cells in windows, to building applications and even photon recycling in liquid-crystal displays.

Can a block copolymer thin film improve photovoltaic performance?

We fabricated a... The authors show that a photovoltaic device composed of a -donor-bridge-acceptor-bridge-type block copolymer thin film exhibits a significant performance improvement over its corresponding... Improved high-efficiency organic solar cells via incorporation of a conjugated polyelectrolyte interlayer.

By using PM6 as the polymer donor and PYT as the third component, we found the ternary all-polymer solar cell (all-PSC) exhibited an impressively high power conversion efficiency of ...

As a result, the photovoltaic performance and mechanical stability of the all-PSCs were greatly enhanced. Notably, with the addition of independently induced molecular stacking and good vertical phase separation, ...

Polymer photovoltaic cell efficiency

The technology of polymer-based organic photovoltaic (OPV) cells has made great progress in the past decade, with the power conversion efficiency increasing from just a ...

A new polymer donor enables binary all-polymer organic photovoltaic cells with 18% efficiency and excellent mechanical robustness

The carrier collection efficiency (η_c) and energy conversion efficiency (η_e) of polymer photovoltaic cells were improved by blending of the semiconducting polymer with C60 or its functionalized der...

Herein, the latest progresses of polymer solar cells with efficiency over 17% are briefly reviewed from the aspects of active material design, interface material development, and device technology. At last, the opportunities and challenges ...

A new polymer donor enables binary all-polymer organic photovoltaic cells with 18% efficiency and excellent mechanical robustness. Adv. Mater. 34, 2205009 (2022).

Underpinning the research on OPV field, Prof LI's study titled, "High-efficiency solution processable polymer photovoltaic cells by self-organization of polymer blends," was ...

Adding electron-withdrawing groups to the backbone of the polymer PBDTTT is shown to increase the open-circuit voltage of photovoltaic cells, resulting in a polymer solar-cell that has a ...

By using PM6 as the polymer donor and PYT as the third component, we found the ternary all-polymer solar cell (all-PSC) exhibited an impressively high power conversion efficiency of 17.2%, which is much higher than those of the binary ...

The application of organic photovoltaic (OPV) cells to drive off-grid microelectronic devices under indoor light has attracted broad attention. As organic ...

The potential applications of polymer solar cells are broad, ranging from flexible solar modules and semitransparent solar cells in windows, to building applications and even photon recycling in...

PV cell efficiency increases with solar irradiance, as the greater number of photons associated with higher solar irradiance creates more electron-hole pairs and consequently more current ...

As a result, the photovoltaic performance and mechanical stability of the all-PSCs were greatly enhanced. Notably, with the addition of independently induced molecular ...

A new near-infrared polymer acceptor, PY2F-T, was developed by connecting the non-fullerene small-molecule acceptor building block (Y6 derivative) through a thiophene spacer. By using ...

Polymer photovoltaic cell efficiency

The photovoltaic conversion efficiency of a cell made with a PTMA-incorporated perovskite layer (0.3 wt.% amount of the polymer vs. the perovskite) and a hole-transporting ...

Controlling the phase morphology of photoactive layers toward satisfactory charge transport with reduced energetic disorder is the key to obtaining targeted efficiencies in organic solar cells ...
