How to reduce charging cost for users and charging piles?

Based Eq. ,to reduce the charging cost for users and charging piles,an effective charging and discharging load scheduling strategy is implemented by setting the charging and discharging power range for energy storage charging piles during different time periods based on peak and off-peak electricity prices in a certain region.

Can energy storage reduce the discharge load of charging piles during peak hours?

Combining Figs. 10 and 11,it can be observed that,based on the cooperative effect of energy storage,in order to further reduce the discharge load of charging piles during peak hours,the optimized scheduling scheme transfers most of the controllable discharge load to the early morning period,thereby further reducing users' charging costs.

How do energy storage charging piles work?

To optimize grid operations, concerning energy storage charging piles connected to the grid, the charging load of energy storage is shifted to nighttime to fill in the valley of the grid's baseline load. During peak electricity consumption periods, priority is given to using stored energy for electric vehicle charging.

How does optimization scheduling work for energy storage charging piles?

a. Based on the charging parameters provided above and guided by time-of-use electricity pricing,the optimization scheduling system for energy storage charging piles calculated the typical daily load curve changes for a certain neighborhood after applying the ordered charging and discharging optimization scheduling method proposed in this study.

How does a charging pile reduce peak-to-Valley ratio?

The proposed method reduces the peak-to-valley ratio of typical loads by 52.8 % compared to the original algorithm, effectively allocates charging piles to store electric power resources during off-peak periods, reduces user charging costs by 16.83 %-26.3 %, and increases Charging pile revenue.
