

Sodium-based battery negative electrode materials

Which material is a negative electrode material for sodium ion batteries?

As negative electrode material for sodium-ion batteries, scientists have tried various materials like Alloys, transition metal di-chalcogenides and hard carbon-based materials. Sn (tin), Sb (antimony), and P (phosphorus) are mostly studied elements in the category of alloys. Phosphorus has the highest theoretical capacity (2596 mAhg⁻¹).

What are negative electrode materials for Na-ion batteries?

This paper sheds light on negative electrode materials for Na-ion batteries: carbonaceous materials, oxides/phosphates (as sodium insertion materials), sodium alloy/compounds and so on. These electrode materials have different reaction mechanisms for electrochemical sodiation/desodiation processes.

Is there a zero-strain negative electrode material for sodium-ion batteries?

So far to the best of our knowledge, no zero-strain negative electrode material is available for sodium-ion batteries although a few types of negative electrode materials have been reported to be active in sodium-ion batteries 9,10,11,12,28,29,30,31,32,33,34,35,36,37,38,39,40,41.

Can aqueous sodium-ion batteries be used as a negative electrode?

Aqueous sodium-ion batteries could be a potential solution for large-scale energy storage, but the conventional negative electrodes are not efficient. Here, the authors report a titanium-substituted tunnel-type Na_{0.44}MnO₂ material as a promising negative electrode for aqueous sodium-ion batteries.

Is Na_{0.44}[Mn_{1-x}Ti_x]O₂ a suitable negative electrode material for sodium-ion batteries?

Both the fundamental understanding and practical demonstrations suggest that Na_{0.44}[Mn_{1-x}Ti_x]O₂ is a promising negative electrode material for aqueous sodium-ion batteries. Aqueous sodium-ion batteries could be a potential solution for large-scale energy storage, but the conventional negative electrodes are not efficient.
