Can chiral molecules improve the stability of perovskite solar cells?

Interfacial engineering is key to ensure the long-term stability of perovskite solar cells. Research now shows that chiral molecules can both improve the mechanical stability of the interfaces and afford passivation of defects at the perovskite surface, making solar cells more tolerant to thermal cycling stress.

Who is developing the solar cell?

The ultra-light, highly efficient solar cell was developed at NREL (National Renewable Energy Laboratory) and is being commercialized by Emcore Corp. of Albuquerque, N.M. in partnership with the Air Force Research Laboratories Space Vehicles Directorate at Kirtland Air Force Base in Albuquerque.

What is research on flexible solar cells?

Research on flexible solar cells involves manufacturing solar cells on flexible substrates using technology such as chemical vapor deposition. An example of this was created at the Massachusetts Institute of Technology.

Do perovskite solar cells have a conflict of interest?

The authors declare no conflict of interest. Abstract As power conversion efficiency (PCE) of perovskite solar cells (PSCs) has rapidly increased up to 25.7% in 2022, a curiosity about the achievable limit of the PCE has prevailed and demands...

How do 3D solar cells function?

3D solar cells, created at the Georgia Tech Research Institute, function by capturing photons from sunlight using an array of miniature 'tower' structures. These structures resemble high-rise buildings in a city street grid. Solar3D, Inc. plans to commercialize such 3D cells, but its technology is currently patent-pending.

How does a solar cell convert solar energy?

Solar cells convert solar energy with record efficiency (40.8% under 326 suns concentration). In this passage, the process of reducing the weight of a solar cell by removing the thick, rigid germanium layer is described. This innovative approach results in an ultra-light and flexible solar cell.
