How does a solar panel generate electricity?

At the heart of a solar panel's ability to generate electricity is the photovoltaic (PV) effect. Discovered in 1839 by French physicist Edmond Becquerel, the PV effect is the process by which solar cells within the panel convert sunlight into electricity.

How does solar PV work?

While the energy source is the same - the sun - the technology in each system is different. Solar PV is based on the photovoltaic effect, by which a photon (the basic unit of light) impacts a semi-conductor surface like silicon and generates the release of an electron.

How does solar energy work?

The amount of sunlight that strikes the earth's surface in an hour and a half is enough to handle the entire world's energy consumption for a full year. Solar technologies convert sunlight into electrical energy either through photovoltaic (PV) panels or through mirrors that concentrate solar radiation.

What are the main components of a solar panel?

Here's a simplified explanation of the main components typically found in such a diagram : Solar panels (photovoltaic modules) : Solar panels are the primary components that capture sunlight and convert it into electrical energy through the photovoltaic effect. These panels are made up of semiconductor materials like silicon.
