

The importance of lithium battery homogenization

What is a homogenized model of a lithium-ion battery?

Homogenization is then used to derive a thermal model of a battery comprising several connected lithium-ion cells. We derive a closed-form solution to the homogenized model when the effective Biot number is small, which corresponds to a spatially uniform battery temperature.

What is a cathode homogenization strategy?

This cathode homogenization strategy contrasts to the conventional cathode heterogeneous design, potentially improving the viability of all-solid-state lithium batteries for commercial applications.

What are thermo-electrochemical models of a lithium-ion battery?

Two thermo-electrochemical models of a lithium-ion battery are proposed. Asymptotics used to construct reduced models for common modes of battery operation. Homogenization used to obtain a model of a battery composed of many cells. Thermal runaway not induced by chemistry alone despite Arrhenius kinetics.

Can matched asymptotic expansions reduce a thermo-electrochemical model of a lithium-ion battery?

Homogenization used to obtain a model of a battery composed of many cells. Thermal runaway not induced by chemistry alone despite Arrhenius kinetics. In this study, matched asymptotic expansions are used to systematically reduce a thermo-electrochemical model of a lithium-ion battery based on volume averaging the electrode microstructure.

Do all-solid-state lithium batteries use heterogeneous composite cathodes?

Nature Energy 9,1084-1094 (2024) Cite this article All-solid-state lithium batteries typically employ heterogeneous composite cathodes where conductive additives are introduced to improve mixed conduction.

Are all-solid-state lithium batteries conductive?

All-solid-state lithium batteries typically employ heterogeneous composite cathodes where conductive additives are introduced to improve mixed conduction. These electrochemically inactive additives are not fully compatible with layered oxide cathodes that undergo large volume change, significantly reducing battery energy density and cycle life.
