What is a start capacitor on a bench grinder?

The start capacitor on a bench grinder helps get the motor running. It is usually cut out once the motor reaches 75% of its operating speed. A run capacitor continues to run after the startup is over and helps the bench grinder continue to run until it is turned off. Replacing a capacitor on a bench grinder is not that difficult.

What is the difference between a start capacitor and a run capacitor?

In a bench grinder, the start capacitor is designed to help get the motor running and is usually cut out once the motor reaches 75% of its operating speed. The run capacitor, on the other hand, continues to run after the startup is over and helps the bench grinder continue to run until it is turned off.

To replace a bench grinder capacitor, first remove the two wires on one end of the old capacitor and then reattach them to the new one. Replacing the old non-working capacitor is easy, but ensuring you have the right one for the job may not be.

Can a 250V start capacitor be replaced?

It is acceptable to use a 250V start capacitor instead of the specified 125V for a bench grinder. The reasoning behind this is that the phase shift caused by the inductive motor winding requires more voltage space.
