Where can compressed air energy be stored?

The number of sites available for compressed air energy storage is higher compared to those of pumped hydro [1]. Porous rocks and cavern reservoirs are also ideal storage sites for CAES. Gas storage locations are capable of being used as sites for storage of compressed air.

What is compressed-air-energy storage (CAES)?

Compressed-air-energy storage (CAES) is a way to store energy for later use using compressed air. At a utility scale, energy generated during periods of low demand can be released during peak load periods. The first utility-scale CAES project was in the Huntorf power plant in Elsfleth, Germany, and is still operational as of 2024.

What is the difference between compressed air and compressed carbon dioxide energy storage?

Compared to compressed air energy storage system, compressed carbon dioxide energy storage system has 9.55 % higher round-trip efficiency, 16.55 % higher cost, and 6 % longer payback period. At other thermal storage temperatures, similar phenomena can be observed for these two systems.

What are the options for underground compressed air energy storage systems?

There are several options for underground compressed air energy storage systems. A cavity underground, capable of sustaining the required pressure as well as being airtight can be utilised for this energy storage application. Mine shafts as well as gas fields are common examples of underground cavities ideal for this energy storage system.

How efficient is adiabatic compressed air storage?

More than 70% efficiency (from literature) was also obtained when thermal energy storage was also integrated in adiabatic CAES systems. With the use of a radial compressor, an adiabatic compressed air storage system operating at a lower temperature was also investigated.

What is a compressed air storage system?

The compressed air storages built above the ground are designed from steel. These types of storage systems can be installed everywhere, and they also tend to produce a higher energy density. The initial capital cost for above-the-ground storage systems are very high.
