

# What to do if a single battery pack is damaged

How to fix a broken battery?

Find the group or groups that have a lower voltage than the rest of the cells and remove it from the pack. After that, those cells just need to be replaced. We hope this article helped you learn everything you needed to know about how to identify and fix a broken battery.

Should a battery pack be replaced?

If a relatively new pack has only one defective cell and a replacement is located, exchanging the affected cell makes sense. With an aged battery, however, it's best to replace all cells. Mixing new with old causes a cell mismatch that has a short life. In a well-matched battery pack all cells have similar capacities.

Can a battery be repaired?

Batteries for power tools and other commercial devices can often be repaired by replacing one or all cells. Finding a NiCd and NiMH cell is relatively easy; locating an appropriate Li-ion cell is more difficult.

How do you protect a lithium ion battery?

Do not mix cells of different chemistry, age or capacity. Never charge or discharge Li-ion batteries unattended without a working protection circuit. Each cell must be monitored individually with a protection circuit. Include a temperature sensor that disrupts the current should the pack get hot.

What happens if a battery pack goes bad?

Battery packs are made from many lithium-ion cells. So if one goes bad, it's more than likely going to negatively impact the surrounding cells. If left unchecked, a bad lithium-ion battery can overheat and go into thermal runaway, which is never a good thing.

How to fix a broken ebike battery?

Step 1: To fix a broken ebike battery, you will need to take the battery pack out of its hard protective casing so that you can get to the cell groups. Step 2: Make sure there are no cracks in the conductor and no burn marks on the cells. Also, make sure there is no liquid coming from anywhere.
